PINARARA

```
The present sequence is that of BASB110 protein from Moraxella CC catarrhalis strain Mc2931 (ATCC 43617), a causative agent of otitis CC media in children and pneumonia in adults. The sequence is a causative agent of otitis CC differs by 1 residue from the predicted polypeptide sequence (see AB20107) of a BASB110 pen product, having Ser rather than Gly at CC polynucleotides encoding them, as well as expression vectors, host CC cells and methods. Also claimed is a vaccine composition comprising a BASB110 polypeptide an immunogenic fragment of a ccid sequence identity to BASB110, or comprising a tleast as amino caid sequence identity to BASB110, or comprising a polypeptide. A claimed therapeutic composition acid sequence identity to BASB110, or comprising a polypeptide or antibody. A claimed therapeutic composition useful infection involves identifying a BASB110 polypeptide or comprising a polypeptide or antibody. A claimed therapeutic composition useful in treating composition useful in reating antibody antibody at least as a claim or actarrhalis infection comprises at least 1 antibody antibody in raising specific antibodies, and in screening for antibacterial drugs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of BASB110 protein from Moraxella CC catarrhalis strain Mc2931 (ATCC 43617), a causative agent of otitis media in children and pneumonia in adults. The sequence is a creative form of a BASB10 pCR product. The sequence is a constitute from the predicted polypeptide sequence (see AAB2016) of CC 104. The invention provides BASB10 pCR product sequence (see AAB2016) of CC polynuclectides encoding them, as well as expression vectors, host cc leis and methods for producting BASB10 polypeptides, and cc cells and methods for producing BASB10 polypeptides, or comprising a BASB110 polypeptide, an immunogenic fragment of a cid sequence identity to BASB10, or comprising a BASB10 polypeptide. The composition cc ancided such a polypeptide. A claimed having at least 88% amino CC Moraxella infection involves identifying a BASB10 polypeptide or cc directed against a BASB10 polypeptide or cc directed against a BASB10 polypeptide. A claimed method of diagnosing a cc directed against a BASB10 polypeptide or cc directed against a BASB10 polypeptide or cc directed against a BASB10 polypeptide. BASB110 polypeptide also cc directed against a BASB110 polypeptide. BASB110 polypeptide as also cc antibacterial drugs.

                                                                                         Ś
                                                                                                                                                                                           The present sequence is the Haemophilus somnus lipoprotein LppB.

Recombinant vaccines containing H. somnus lipoproteins LppA, LppB
and LppC have been described. H. somnus transferrin-binding proteins Tbp1
and Tbp2 have also been found to be effective in vaccines against
H. somnus infection. Clones expressing Tbp epitopes were identified by
screening a genomic expression library of H. somnus strain HS25 in
E. coli with polyclonal antiserum raised against affinity-purified Tbp1
and Tbp2 of H. somnus. The genes coding for Tbp1 and Tbp2 were obtained
by inverse PCR. The nucleotide sequence encoding Tbp1 and Tbp2 may be
used for the recombinant production of Tbp1 and Tbp2, which may then be
used to manufacture vaccine compositions for immunising against H. somnus
infections. The antibodies raised against the transferrin binding
proteins may also be used diagnostically to identify the presence of
that causes a number of diseases in cattle such as thromboembolic
meningencephalitis (ITEME), myocarditis, septicaemia, arthritis and

Thersen J, P
represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. ARZ54537 to ARZ54576 and ARZ54616 to ARZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigenic; diagnosis; immunogenic; infection; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gomorrheae polynucleotides and polypeptides. AAZ54573 to AAZ54576 and AAZ545616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic respents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                320

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54375 to AAZ54576 and AAZ54516 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dominguez-Bernal G, Garri

                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of the Listeria p60 protein. Antibodies generated against the protein can be used in the detection of Listeria by immunoassay (partic. ELISA). The detection method allows determination of individual Listeria species, esp.

                                                                                                                                                                                                                                                                                                             The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The production helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                   Ś
                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the genome sequence of Listeria commonocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. commoncytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein concottogenes and other genomes. The present invention. Proteins composes of from the genome sequence of the present invention. Proteins composes of from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin CC antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of Vitamin CC and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are also useful for selecting compositions for the treatment or prevention of infections by L. compositions for the treatment or prevention of infections by L. compositions for this patient did not form part of the printed specification, but was obtained in electronic format directly from WIPO at figure in the genome sequence adata for this patient did not form part of the printed specification, but was obtained pot_sequences.

                                      AAR73913 is the Listeria monocytogenes protein P60 precursor. It contains the meningitis related antigenic sequences (MRHAS) claimed in AAR73891-R73894 and AAR73903-R73906, which are recognised by a monoclonal antibody from the hybridoma Rubella virus (RV)-1. The claimed MRHAS peptides may be used in immunoassays to diagnose the presence of bacterial and/or viral meningitis agents in a sample, or in prophylactic and therapeutic meningitis treatments. The

These can be used in the production of vaccines against H. Children, pneumonia in elders, simusitis, nosocomial infections, or invented in the middle ear, simusitis, nosocomial infections, or accumulation in the middle ear, auditive nerve damage, delayed speech the middle ear. The present sequence is a version of the BASB201 protein sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of several versions of the BASB201 protein from non-typeable Haemophilus influenzae. These can be used in the production of vaccines against H. influenzae infection, which can cause otitis media in infants and children, pneumonia in elders, sinusitis, nosocomial infections, or invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditive nerve damage, delayed speech learning, infections of the upper respiratory tract and inflammation of the middle ear. The present sequence is a version of the BASB201 proteins.

The process can be used in the manufacture of products containing cultures of lactic acid bacteria e.g. cheese, where the culture lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin needs to be added and lysin does not need to be isolated or encapsulated. The time of lysis can be precisely controlled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABL50555 to ABL50562 represent contigs 1 to 8 from the Micromonospora carbonaces everninomicin biosynthetic locus gene cluster. The contigs encode the protein sequences designated ORF (open reading frame) 1 to a protein of the everninomicin antibiotic in overproducing strains, and to allow chemical modifications of everninomicin to enhance certains, gene cluster can be used to produce wis genetic manipulation or combinational biosynthesis. The gene cluster can be used to produce genetic systems and genet manipulation or combinational biosynthesis. The novel enzyme activities, and avoid the problems of low yield and quality of everninomicins produced by chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 15; Fig 1; 181pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated gene cluster encoding polypeptides involved in everninomicin biosynthesis useful for construction of everninomicin of everninomicin strains, and to allow chemical modifications of everninomicin to enhance certain properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Staffa A,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention is related to a Lactococcus lactis nucleotide nucleic acid sequence (ABA90521) and related proteins (ABB53300-ABB55521). The nucleic acid sequence is useful in the detection and/or amplification of related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The production helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleotide sequence useful in the identification or Lactococcus lactis and related species -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of several versions of the BASB201 protein from non-typeable Haemophilus influenzae. These can be used in the production of vaccines against H. influenzae infection, which can cause otitis media in infants and children, pneumonia in elders, sinusitis, nosocomial infections, or invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditive nerve damage, delayed speech learning, infections of the upper respiratory tract and inflammation of the middle ear. The present sequence is a version of the BASB201 protein

The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as immunoassay reagents) usual hybridisation and amplification assays for detecting infection. The present sequence represents a HEV-US2 ORF1 protein.

                                                                                                                                                                                                     The protein sequence of the beta lytic peptidase from Achromobacter lyticus was deduced from the DNA sequence obtd. by PCR using primers based on the sequence of the L. enzymogenes beta-protease. The beta-lytic protease is expected to be an enzyme which can decompose not only Gram-positive bacteria but also some Gram-negative bacteria.
                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                     Beta-lytic protease gene and DNA encoding it - Gram-positive and some Gram-negative bacteria

The present sequence is a Achromobacter lyticus beta-lytic protease which has anti-staphylococcal activity. The beta-lytic protease gene is used in the production of altered genes which allow expression and preferably secretion of active protein in mammalian cells/tissues. The altered gene is produced by operably linking the beta-lytic protease coding sequence with mammalian promoter, signal peptide and translation initiation sequences. The modified sequence is used in gene therapy to treat staphylococcal mastitis infections runinants, e.g. goats, sheep, and cows. It is also used to produce transgenic animals which are resistant to staphylococcal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Beta-lytic protease; antibiotic; anti-staphylococcal; gene therapy; mastitis; staphylococcal infection; rum transgenic animal; altered beta-lytic protease gene.

                                                                                                                                                                                           mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutanicum. Tare useful for identifying the mutation point of a gene derived from mutant of corvneform bacterium, measuring expression amount and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
            CC The invention relates to RP-factors which are substances that can CC resuscitate dormant, moribund or latent cells, possibly also having CC growth-stimulating activity. Host cells containing a vector comprising CC the RP-factor or its receptor encoding nucleic acid can be used for the CC convertases, antibodies (against the RP-factors, their receptors or CC convertases, antibodies (against the RP-factors and RP-factor receptors or CC convertases), antagonists and agonists, are useful in vaccines and for CC excipients, generally as antimicrobials and especially for infections CC associated with latency. They can be used as potentiators of antibiotics such as isoniazid, streptomycin etc., in treatment of tuberculosis. CC RP-factor can also be used: to determine the microbiological quality of foods, pharmaceuticals, medical products; as culture additive for CC produce libraries of biomolecules and microorganisms (which may then be creened for useful products). Probes complementary to the RP-factor culcic acid are used identify and clone other RP-factor genes. The CC inventions may also be used to prevent bacterial resuscitation. Breaking CC dormancy with RP-factor facilitates detection, culture and enumeration of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the contractor of the

In situ production of a homologous autolysin or a heterologous autolysin from a food grade Gram positive bacteria, can be used in process for the lysis of a culture of lactic acid bacteria. The cultures of lactic acid bacteria the manufacture of products containing lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin needs to be added and the lysin does not need to be isolated or encapsulated. The time of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (C comprises: (a) an oligo-dry primer and an oligonucleotide complementary for the following primer and an oligonucleotide which comprises one of the temperature strand of a polymucleotide which comprises one of complementary strand of a polymucleotide which comprises one of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination complementary strand of a polymucleotide which comprises a 5'-end comprises and an oligonucleotide comprising a sequence complementary to a complementary strand of a polymucleotide which comprises a 5'-end complementary to a comprise which comprises a 3'-end sequence complementary to a coligonucleotide comprises a 3'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primers set can be used in antisense therapy and confidence of the specification. The primers are useful for synthesising polymucleotides, and the comprises at least 15 nucleotides and the combination of the specification. The primers are useful for synthesising polymucleotides, and the comprise of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 24

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH18628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB82446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                          BVH-P1 gene; streptococcal infection; pharyngitis; erysipelas; impetigo; scarlet fever; bacteraemia; necrotising fascitis; toxic shock; vaccine; immune response; anti-inflammatory; immunisation; antibacterial.
 The invention relates to antigens,
                         Claim 21; Fig 16;
                                                  New Streptococcus pyogenes antigen useful for diagnosing, treating streptococcal infection, e.g. pharyngitis, erysimpetigo, scarlet fever, and invasive diseases
                                                                                                                                            Martin D,
                                                                                                                                                                                                06-JUL-2000; 2000US-216465P
                                                                                                                                                                                                                        06-JUL-2001; 2001WO-CA01001

The polypeptides and polynucleotides encoding them are useful for diagnosing, preventing or treating streptococcal infection, such as pharyngitis, erysipelas, impetigo, scarlet fever, invasive diseases (bacteraemia, necrotising fascitis, toxic shock), and for eliciting an immune response. The polypeptides may also be used as immunogens for producing antibodies for the diagnosis and treatment of streptococcus infection, or for passive immunisation. DNAs encoding polypeptides may also be used to design DNA probes for detecting the presence of streptococcus in biological samples suspected of containing the bacteria. The vaccine composition is useful as a prophylactic or therapeutic treatment of Streptococcal infection. The present susceptible to or infected with streptococcal infection. The present

Dacterial pathogen. The polypeptides and polynucleotides encoding them are useful for diagnosing, preventing or treating streptococcal infection, such as pharyngitis, erysipelas, impetigo, scarlet fever, invasive diseases (bacteraemia, necrotising fascitis, toxic shock), and for eliciting an immune response. The polypeptides may also be used as immunogens for producing antibodies for the diagnosis and treatment of Streptococcus infection, or for passive immunisation. DNAs encoding polypeptides may also be used to design DNA probes for detecting the presente of Streptococcus in biological samples suspected of containing the reapputic treatment of Streptococcal infection in an individual susceptible to or infected with streptococcal infection. The present susceptible to or infected with streptococcal infection. The present sequence is Streptococcus pyogenes strain B514 BVH-P1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                   밁
                                                                                                                      Ş
                                                                                                                                                                                                                                                       The invention relates to a recombinant cellulase active protein free of CC proteinases of mative thermophilic and alkalinophilic origin, comprising CC the truncated sequences Cel B5, Cel B4/5, Cel E1/2/3, Cel 1/2/3, CC Cel 6 or Cel E3/B5, or a stability region from one of the defined full-CC length sequences, or functional equivalents. Cel B4/5 extends from amino CC acid A1011 to P1424 or K1425 or N1426, and Cel B4/5 extends from amino CC acid K635 to N1426 in the sequence shown in ANY13492; Cel E1 extends from maino acid Y39 to D481, Cel E1/2 extends from Y39 to G635, Cel E1/2/3 extends from Y39 to G812, Cel E6 extends from amino acid C123) to CK1751 and the stability region extends from amino acid E402 to G635 in CC K1751 and the stability region extends from amino acid E402 to G635 in CC K1751 and the stability region extends from amino acid E402 to G635 in CC K1751 and the stability of E3/B5 is shown in ANY13494. The new cenzymes are useful in laundry detergent compositions to prevent or CC remove staining, backstaining or graying, for use on cellulosic CC corpreventing redeposition of colorant during stonewashing, and for processing of textiles where cellulose breakdown is required. The new CC truncated enzymes show reduced redeposition of dye compared to using CC non-truncated cellulase compositions.
                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a cellulase active protein, which is substantially free of proteinases of native thermophilic and alkalinophilic origin, where the cellulase active protein consists of the CelB5 amino acid sequence. The cellulase active protein is useful for treating cellulosic materials including cotton-containing fabrics, as detergent additives. The cellulase active protein is also useful for improving the feel and/or appearance of cotton-containing fabrics, for removing surface fibers from cotton-containing knits or for imparting stonewashed appearance to cotton-containing denims. The present proteins are stable under condition of alkaline pH and elevated temperatures, thus suitable for textile processing and in commercial detergents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       autolysin from a food grade Gram positive bacteria, can be used in a process for the lysis of a culture of lactic acid bacteria. The process can be used in the manufacture of products containing cultures of lactic acid bacteria e.g. cheese, where the culture is lysed following the completion of fermentation. The enhanced induction of the autolysin is performed some hours after the fermentation is finished. No extra lysin needs to be added and the lysin does not need to be isolated or encapsulated. The time of lysis can be precisely controlled. See AAR85285 for the complete
Human clone vb22_1 ORF2, SEQ ID NO:130.

The invention relates to 40 human secreted proteins (AAY94981-Y95020), CC and cDNA sequences encoding them (AAA21423-A23462). The secreted CC proteins of the invention include those that are thought to be only CC partially secreted, i.e., transmembrane proteins. The proteins of the CI invention may exhibit one or more activities selected from the following: CC cytokine activity; cell proliferation, differentiation; immune CC modulation, haematopoiesis regulation, tissue growth activity; haemostatic clambition activity. The proteins may be administered to patients as CC vaccines, and the nucleotides may be used as part of a gene therapy credime. Diseases or conditions that may be treated using the proteins or conclectides of the invention include autoimmune diseases; genetic CC disorders, haemophilia; cardiovascular diseases; cancer; bacterial, CC fungal and viral infections, especially HIV, multiple sclerosis; culcers, osteoprosis, osteoparthritis, periodontal diseases, burns, CC ulcrs, osteoprosis, osteoarthritis, periodontal diseases and amyotrophic classes, parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis (ALS). Proteins with activin/inhibin activity may can be used for treating wounds, burns, CC lateral sclerosis (ALS). Proteins with activin/inhibin activity may conditionally be used in chromosome mapping, and as source of the covantion may be used in chromosome mapping, and as a source of the covantion may be used in chromosome mapping, and as a source of the cDNA clones of the invention.

The method involves using proteins that contain least one binding motif for proteins of the Ena/NASP (vasodilator-stimulated phosphoprotein) family in the preparation of reagents for identification/screening of molecules that modulate formation of the actin cytoskeleton. The proteins used in the method (i.e. the proteins with binding motif (s) for Ena/VASP proteins) do not bind to the Arp2/3 protein complex. The modulators identified by the method are potentially useful for treating disorders of actin polymerisation, e.g. metastatic cancer or parasitic infection; and as cytotoxic agents. The present sequence one such protein with binding motif (s) for Ena/VASP proteins, which was used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying modulators of actin polymerization, potentially useful for treating tumor metastasis and parasitic infection, using proteins that contain Ena/VASp binding sites -

Peptide fragments of WASP-family proteins of eukaryotic cells are used to prepare reagents for detecting compounds that inhibit or stimulate formation of the actin cytoskeleton, and thus inhibit or stimulate cell motility. The peptides are used to detect and identify compounds which are potentially useful for treating diseases associated with dysfunction of actin polymerisation, particularly metastatic cancer and parasite infection; as cytotoxic agents for inhibiting/stimulating formation of the actin cytoskeleton and for detecting side-effects, on actin polymerisation, of pharmaceuticals. By modulating actin polymerisation, these compounds affect cell motility, embryonic development, the immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                           The invention relates to human MAGI protein, which is similar to neuroendocrine-specific protein. The MAGI protein can be expressed by standard recombinant methodology. The MAGI polypeptides, polynucleotides and antibodies are useful for treating diseases, including neuropathies, spinal injury, neuronal degeneration, neuromuscular disorders, stroke and inflammatory disorders and developmental disorders, cancer, stroke and inflammatory disorders. The polynucleotide is also useful for chromosome localization and for tissue expression studies. The present sequence represents the human MAGI protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MAGI protein; neuroendocrine-specific protein; neuropathy; human; spinal injury; neuronal degeneration; neuromuscular disorder; can psychiatric disorder; developmental disorder; inflammatory disord stroke; cytostatic; cerebroprotective; neuroprotective.
                                                                                                                                                                                                                         Novel polypeptides related to neuroendocrine-specific proteins and polynucleotides useful for diagnosis of various diseases and for treatment of cancer and neurological disorders -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is the human Nogo protein, a 250kDa myelin-associated axon growth inhibitor. The invention relates to the use of the nogo receptor, nogo protein, their nucleic acids, vectors expressing them and antibodies growth. The agent is useful for treating a central nervous system disorder which is a result of treating a central nervous system injury, stroke or a demyelinating disease selected from multiple sclerosis, monophasis demyelination, encephalomyelitis, multifocal pontine myelinolysis, adrennoleukodystrophy, Pelizaaus-Merzbacher disease, Spongy degeneration, Alexander's disease, Canavan's disease, metachromatic leukodystrophy, viral infection and Krabbe's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; Page 101-104; 109pp; English.

NOGO-A is a previously known splice variant of the human NOGO gene on chromosome 2p21. The invention relates to a novel splice variant, NOGO-C (see AAB82348). It provides NOGO-C polypeptides and polymucleotides, and methods for producing such polypeptides by recombinant techniques. Also disclosed are methods for utilising NOGO-C polypeptides and polymucleotides in the treatment of diseases including neuropathies, spinal injury, brain injury, stroke, neuronal degeneration, for example Alzheimer's disease and Parkinson's disease, neuromuscular disorders, psychiatric disorders and developmental disorders. Also provided are methods for identifying agonists and agonists for use in treating conditions assets associated with NOGO-C imbalance, and diagnostic assays for detecting disease associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or

This invention describes a swine hepatitis E virus (HEV) and its natural mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection

a human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation, as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antigens, more particularly an antigen of CC Streptococcus gyogenes (also called group A Streptococcus (GAS))

CC are useful for diagnosing, preventing or treating streptococcal for are useful for diagnosing, preventing or treating streptococcal infection, such as pharyngitis, erysipelas, impetigo, scarlet fever, CC for eliciting an immune response. The polypeptides may also be used as CC streptococcus infection, or for passive inmunisation. DNAs encoding the CC streptococcus infection, or for passive inmunisation. DNAs encoding to CC polypeptides may also be used to design DNA probes for detecting the CC polypeptides of Streptococcus in biological sampless suspected of containing the CC presence of Streptococcus in biological sampless suspected of containing the bacteria. The vaccine composition is useful as a prophylactic or cc used public treatment of Streptococcal infection in an individual cc sequence is Streptococcus pyogenes strain SPY57 BVH-P1 mature protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying

Cobacterial pathogen. The polypeptides and polynucleotides encoding them are useful for diagnosing, preventing or treating streptococcal infection, such as pharyngitis, erysipelas, impetigo, scarlet fever, invasive diseases (bacteraemia, necrotising fascitis, toxic shock), and for eliciting an immune response. The polypeptides may also be used as immunogens for producing antibodies for the diagnosis and treatment of Streptococcus infection, or for passive inmmunisation. DNAs encoding polypeptides may also be used to design DNA probes for detecting the polypeptides may also be used to design DNA probes for detecting the presence of Streptococcus in biological samples suspected of containing the bacteria. The vaccine composition is useful as a prophylactic or therapeutic treatment of Streptococcal infection in an individual susceptible to or infected with streptococcal in fection. The present
